

a BglIX directly supports one biochemical step

Exact public sequence identity and recombinant-enzyme HPLC support do not establish the complete Rb1-to-CK chain.

b Reported coordinates and exact primers identify adjacent coding sequences

The public record does not resolve a single BbBgl gene identity.

c AGORA2 contains generic hydrolase annotation but no explicit Rb1-chain representation

Complete local-release scan: 7,302/7,302 SBML models read successfully.
